"A novel dimer configuration revealed by the crystal struct A resolution of human interleukin-5.";
Nature 363:172-176(1993).
-I- FUNCTION: Factor that induces terminal differentiation developing B-cells to immunoglobulin secreting cells.
-I- SUBUNIT: Homodimer; disulfide-linked.
-I- SUBCELLULAR LOCATION: Secreted.
-I- SIMILARITY: Belongs to the IL-5 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDINE=88041112; PubMed=2823259;

                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences AAY58219-Y58220 represent encoded and mature canine interleukin CC -5 (IL-5). The invention relates to canine IL-4, canine or feline Plt-3 CC canine IL-5, canine or feline Plt-3 CC canine IL-5, canine or feline CD40, canine or feline CD54 (CD40 ligand), CC canine IL-5, canine IL-13, feline interferon-alpha (ITM-alpha) and feline CC qranulocyte macrophage colony-stimulating factor (GMCSP), and nucleotides CC which encode these immunoregulatory proteins. The proteins, their CC associated nucleic acids, specific antibodies and inhibitors may be used CC as vaccines for therapeutic or prophylactic regulation of an immune CC response in animals (particularly cats, dogs, horses and humans). They CC may be used to treat autoimmune or infectious diseases including CC allergies, tumours, inflammation and graft rejection, and to increase the CC response from a co-administered antigen. The nucleotide sequences can CC also be used for the recombinant production of a protein, while CC nucleotide fragments are useful as probes, as amplification primers and CC also be used for the recombinant production of a protein, while cc factivity, while the antibodies may be used in detection, and in drug
                                                                                                                                                                                                                        Query Match

The invention relates to canine IL-4, canine or feline Plt-3 CC ligand, canine or feline CD104, canine cD154 (CD40 ligand).

CC canine IL-5, canine II-13, feline interferon-alpha (IFN-alpha) and feline Cgranulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins their cassociated nucleic acids, specific antibodies and inhibitors may be used a vaccines for therapeutic or prophylactic regulation of an immune cresponse in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the cresponse from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while can be used for the recombinant production of a protein, while can concleotide fragments are useful as probes, as amplification primers and concleotide fragments are useful as probes, as amplification, and in drug of activity, while the antibodies may be used in detection, and in drug

This can be used to treat allergies, cancer and inflammatory reactions in dogs. The present sequence is one version of the II-5 protein shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Guo H,

This protein sequence represents ovine interleukin-5 (IL-5). Ovine IL-5 (C or IL-12 are used to treat and/or prevent infections in livestock (esp. CC cows and sheep), particularly where the animals are stressed, e.g. during CC transport IL-5 and IL-12 can also be used as adjuvants in vaccines for CC veterinary use (partic. weakly immunogenic subunit or synthetic peptide vaccines). They may also be used to treat cancer, immunosuppression and CC allergy, to enhance/suppress the reproductive system and to promote CC growth or early maturity. Optionally interleukin can be delivered from CC constructs or delivery cells and antibodies are useful in enzyme constructs or delivery cells and antibodies are useful in enzyme constructs or delivery cells and antibodies are useful in enzyme constructs or delivery cells and antibodies are useful in enzyme constructs or delivery cells and antibodies are useful in enzyme constructs or delivery cells and generation of cytotoxic cells from CC haematopoistic progenitor cells and generation of cytotoxic cells from CC thymocytes, also it stimulates production and secretion of IgM and IgA CC (in synergism with bacterial endotoxin). IL-12 induces production of CC gamma-interferon by, and proliferation of, T and NK cells and increases CC can also be used for in vitro production of IL-5 or -12. (Updated on 17-CC OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    resistance to proteolysis compared to unmodified cytokines. The invention also relates to nucleic acid molecules encoding the cytokines, a pharmaceutical composition comprising a nucleic acid molecule in a pharmaceutical carrier, and a method of generating a protein or peptide molecule having a predetermined property or activity, or a pre-selected altered phenotype. The modified cytokine is selected from a member of the interferons (IFNs)/interleukin (II)-10 protein family, a member of the long-chain cytokine family or a member of the short-chain cytokine family. The composition and method are useful for diagnosing and treating diseases such as infections, allergies, heart diseases or neurodegenerative diseases. This sequence represents a human modified cytokine for the interferon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens.

The invention also relates to nucleic acid molecules encoding the cytokines, a pharmaceutical composition comprising a nucleic acid molecule in a pharmaceutical carrier, and a method of generating a protein or peptide molecule having a predetermined property or activity, or a pre-selected altered phenotype. The modified cytokine is selected from a member of the interferons (IFNs)/interleukin (IL)-10 protein family, a member of the long-chain cytokine family or a member of the short-chain cytokine family. The composition and method are useful for diagnosing and treating diseases such as infections, allergies, heart diseases cancer, liver neurodegenerative diseases. This sequence represents a human modified

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TMF, TMFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct variant which comprises 2 human interleukin 5 (IL5) monomers joined by diglycine linker and including terminally positioned tetanus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the invention

It can be used to stimulate prodn. of immunoglobulins, esp. IgA, for treating respiratory and gastrointestinal infections. The protein is produced by recombinant DNA techniques using mRNA from cells showing BoCSF activity (ATCC CRL 8179). The cloned DNA can also be engineered to express mutants with improved properties.                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant human B-cell differentiation factor - used for diagnosis or treatment of immuno:deficiency diseases, various infections and cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 112
                                                                                                                            Sequence 115
                                                                                                                                                                                                                   BCDF has an approx. molecular weight of 13,149. The BCDF is useful in the diagnosis or treatment of e.g. immunodeficiency diseases which occur due to the deficiency of this factor in a living body and also in the treatment of various infections and cancers.                                                                                                                                                                                                               The present invention is concerned with methods of treating asthma, eosinophilia, allergic rhinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 proteins and their coding sequence down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and

The invention relates to a composition comprising: (a) a non-natural molecular scaffold comprising: (1) a core particle of a non-natural origin; and (2) a core particle of a non-natural origin; and (i) an organiser comprising at least one first attachment site, where the organiser is connected to the core particle by at least one covalent bond; (b) an antigen or antigenic determinant with at least one second attachment site, where the antigen or antigenic determinant is amyloid beta peptide (Abeta 1-42) or its fragment, and where the second attachment site is selected from: (1) an attachment site not naturally occurring with the antigen or antigenic determinant; and (ii) an attachment site naturally occurring with the antigen or antigenic determinant; where the second attachment site is association through at least one non-peptide bond to the first attachment site; and where the antigen or antigenic determinant and the second interact.

through the association to form an ordered and repetitive antigen Also included is a process for producing a non-naturally occurring ordered and repetitive antigen array. The composition is used in

array

The invention relates to a composition comprising a virus-like particle and at least one antigen, which is a protein or peptide of interleukin (II)-5, II-13 or eotaxin and is bound to the virus-like particle, or a core particle with at least one first attachment site and at least one antigen with at least one second attachment site, where the antigen is a protein or peptide of II-5, II-13 or eotaxin. The second attachment site is an attachment site naturally or not naturally occurring with the antigen or antigenic determinant. The second attachment site is capable of association to the first attachment site, and where the antigen or antigenic determinant and the core particle interact through the association to form an ordered and repetitive antigen array. The compositions are useful as medicaments, or for manufacturing a medicament or a vaccine for treating allergic eosinophilic diseases, e.g. asthma, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        analogues. The immunogenic analogue is useful for preparing a for treating inflammatory diseases, e.g., arthritis. It is al gene therapy. The present sequence is human mature IL5 protei sequence is used to illustrate the method of the invention

Patent No. US20020127200A1

GENERAL INFORMATION:
APPLICANT: Vang, Shumin
APPLICANT: Webcall, Catherine A.

APPLICANT: Weber, Bric R.

TITLE OF INVENTION: CANINE AND FELINE IMMUNOREGULATORY PROTEINS, NUCLEIC TITLE OF INVENTION: ACID MOLECULES, AND USES THEREOF
FILE REFERENCE: IM-2-C1-C1
CURRENT APPLICATION NUMBER: US/09/755,633

CURRENT APPLICATION NUMBER: 09/322,409
PRIOR APPLICATION NUMBER: 09/322,409
PRIOR FILING DATE: 1999-05-28

PRIOR APPLICATION NUMBER: 60/087,306
PRIOR FILING DATE: 1998-05-29

NUMBER OF SEQ ID NOS: 21

SOFTWARE: Patentin Ver. 2.1

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
